G + S (Hall 13, Booth 14)

Today, portable power is increasingly in demand. Often there is no power available when mobile phone, GPS or MP3 devices must be loaded. The same goes for lighting, small refrigerators, pumps, GPS tracking and electricity in remote areas. For this need, the ingenious concept of solar-G + S Pfaffen-Schwabenheim provides a number of innovative solar products. The concept means flexible, walk-in solar panels for caravanning, yachting and hobbies. This ingenious solar-concept is based on the unique Flexcell VHF technology to produce a new generation of thin film solar panels instead of glass. Compared to the traditional production of crystalline modules, the Flex Cell technology uses 300 times less raw material, which requires high volume production and low power consumption. Flexcell manufactures thin, lightweight and flexible solar cells and used for a proprietary coating technique where a single amorphous silicon layer is deposited. G + S offers depending on the application, solar 7-75 watts as complete systems.

Maybe that when G + S and the interior of your new motorhome fully upholstered and provided with new fabric and leather designs, is still a core business.
